RZR LEAD QUALITY · EXECUTIVE READOUT

RZR Lead Quality: 46 closures left on the table

April–September 2009 lead performance and the next investment tests

CLOSURE GAP

46

more closures required to reach the 9.6% target at the same volume

THE OPPORTUNITY

The growth gap is measurable

At the current lead volume, moving from the observed close rate to target requires 46 additional closures.

EXECUTIVE DASHBOARD

3,021

leads

April–September 2009

245

PROGRESS TO TARGET

MEASUREMENT LAYER

Fix the measurement layer before scaling spend

The observed close rate is a conservative snapshot because most rows have no final call status.

70.8%

Blank CallStatus

Observed closure is a conservative snapshot.

393

Secondary-stage signal

Closed or EP Sent/Received/Confirmed; 13.0% of leads.

488

Bad-status group

16.2% of the dataset.

DASHBOARD VIEW

Status completeness

Separate blank, pending, unknown, and final dispositions.

Maturity window

Read cohorts after a fixed observation period.

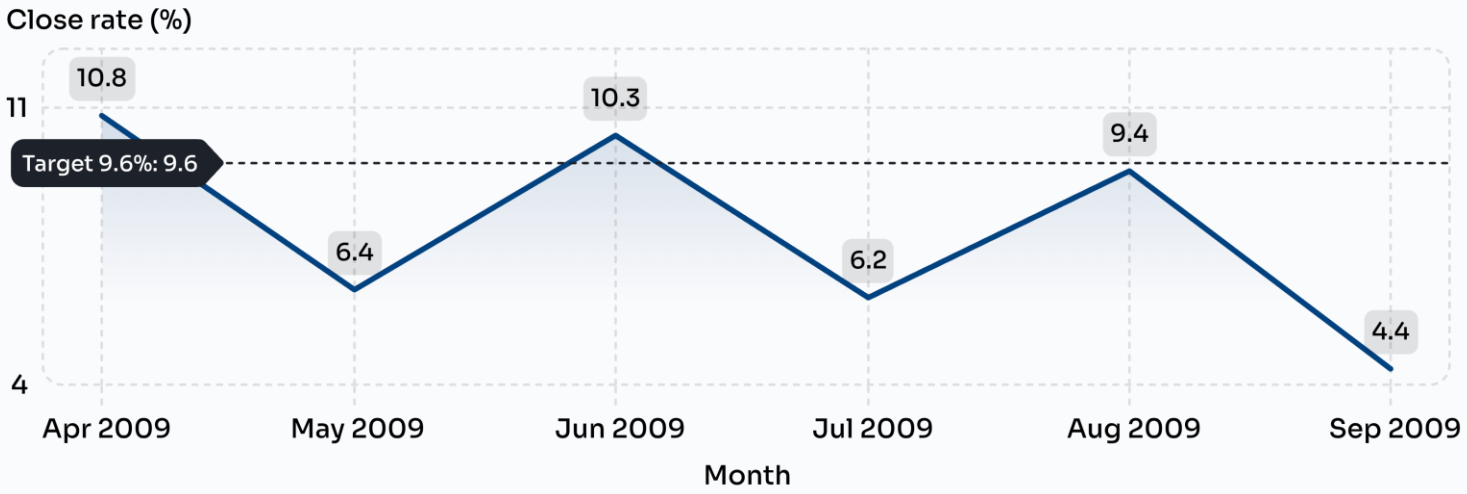

Known / final coverage

Show how much of the dataset can support a closure decision.

COHORT VIEW · APR–SEP 2009

Close rate fluctuates, then bottoms at 4.4%

Monthly differences are significant (chi-square p=0.0007). A simple trend shows declining odds per 30 days (OR 0.896, p=0.0074).

DECISION GUARDRAIL

4.4%

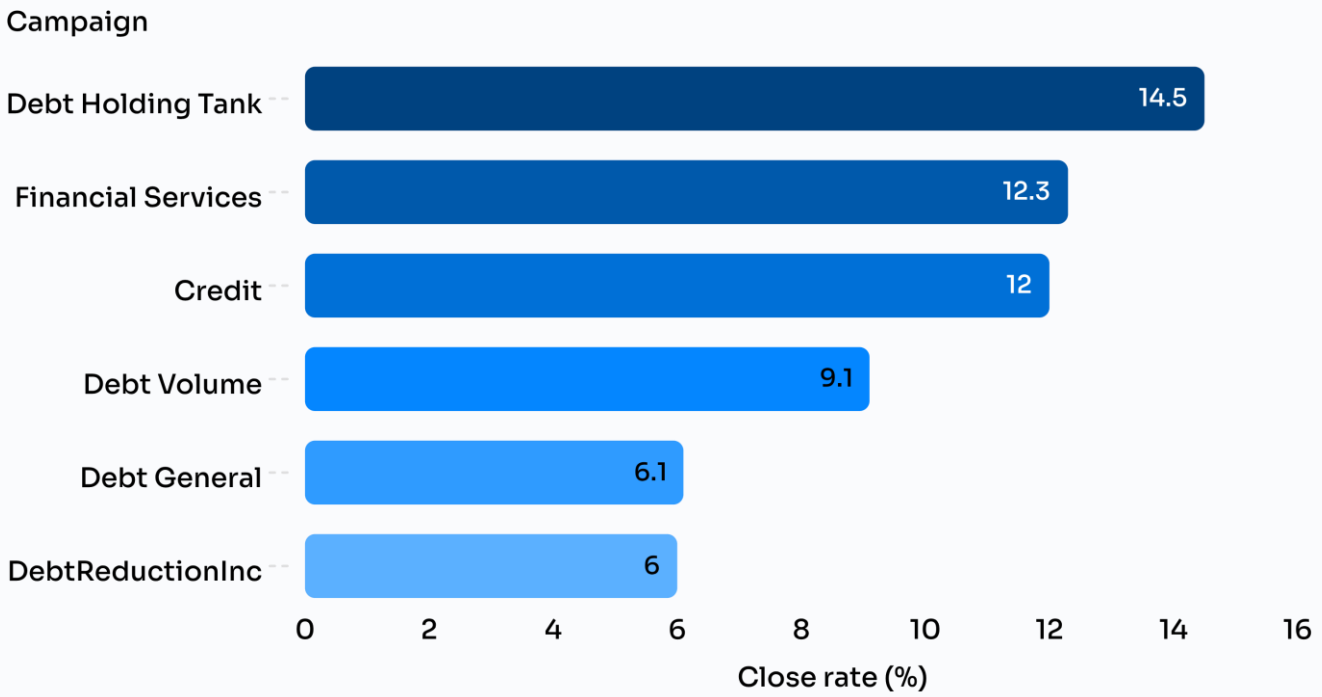

September low

Use a cohort dashboard with a fixed 30/60-day maturity window before calling this traffic deterioration.

CAMPAIGN HYPOTHESIS

Debt Holding Tank is the clearest campaign hypothesis

Debt Holding Tank materially outperforms the highest-volume campaign and deserves a controlled test.

14.5%

Debt Holding Tank · 49 of 338 leads

6.0%

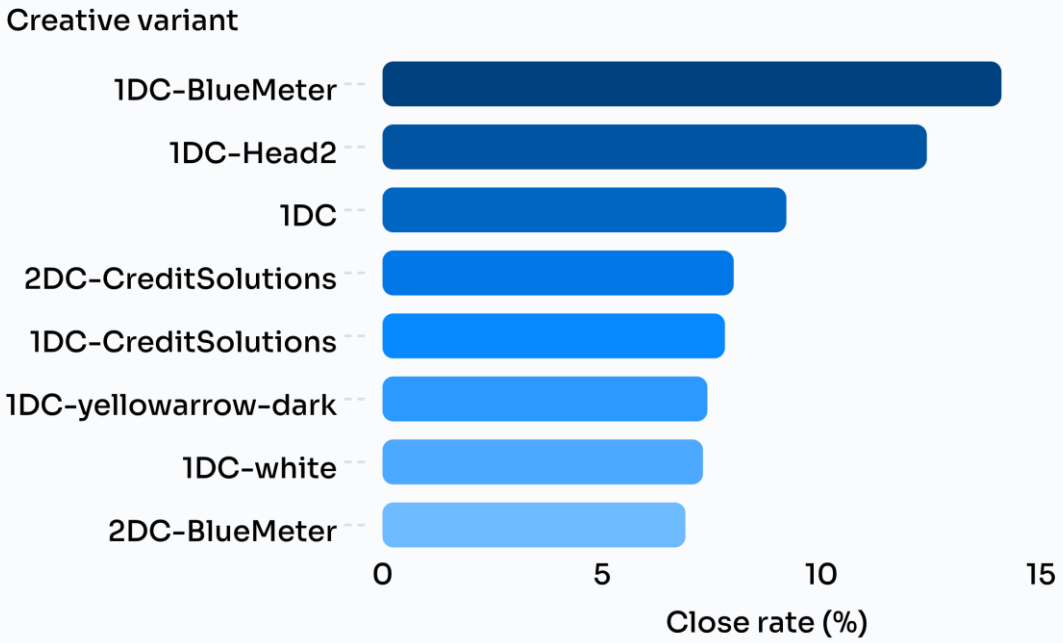

DebtReductionInc · 88 of 1,473 leads

Gap: 8.5 percentage points. Adjusted odds are 2.18× higher for Debt Holding Tank. Association to validate, not proof that the campaign label causes the lift.

CREATIVE HYPOTHESIS

BlueMeter 1DC is a promising creative test

BlueMeter 1DC leads the selected creative variants, but its sample is much smaller than the incumbent.

14.1% vs 7.8%

BlueMeter 1DC: 14.1% across 92 leads. CreditSolutions 1DC: 7.8% across 1,131 leads.

Observed difference: 6.3 percentage points; smaller sample is exploratory (unadjusted p=0.033).

Test within the same campaign, partner, placement, and period.

Leads by chart order: 92, 89, 620, 75, 1,131, 135, 436, 87.

AUDIENCE SIGNALS

Audience signals are useful, but not ready for blind targeting

Debt-band spread is directional. Channel and ad-type differences are not statistically significant.

Signal	Observed result	Decision use
Debt band spread	13.7% for $70,001–$90,000 vs 3.7% for More_than_100000	Standardize overlapping debt bands before targeting
Channel	Call-center 9.6% vs online 8.0%; p=0.348	No statistically significant difference
Ad type	Generic 8.3% vs branded 7.8%; p=0.605	No statistically significant difference

Next analytical cut: evaluate score fields only on comparable, complete cohorts.

INVESTMENT PATH

Next move: validate, test, then scale

01

Validate

Separate pending, unknown, Closed, and truly missing statuses; define a fixed maturity window.

02

Campaign test

Time-balanced incremental traffic to Debt Holding Tank vs DebtReductionInc.

03

Creative test

A/B test BlueMeter 1DC against CreditSolutions 1DC in matched conditions.

04

Targeting review

Investigate keyword, partner, placement, debt-band, and referring-domain mix.

05

Scale carefully

Increase budget only after durable lift and attractive closed-lead economics.

Planning note: a rough 8.0% to 9.6% lift test needs about 4,900 leads per arm for 80% power at two-sided 5% significance.
